Abstract

An interferometer system comprises a reference surface, a support for an object providing an object surface, radiation source for emitting radiation of an adjustable frequency onto the reference surface and the position-sensitive radiation surface, a detector, controller for adjusting a plurality of different frequencies of the radiation emitted by the radiation 10 source, and an integrator for averaging the interference patterns superposed on the radiation detector at different Moreover, there is provided a method for frequencies. recording an interferogram, a method for providing an object with a target surface as well as a method for 15 manufacturing an object with a target surface.
